## PROCESS FOR THE PREPARATION OF 1,4-DIHYDROPYRIDINES AND COMPOUNDS USED IN THIS PROCESS

The present invention relates to a process for the preparation of certain 1,4-dihydropyridines having an amino group attached to a substituent in the 2-position of the 1,4-dihydropyridinium ring and pharmaceutically acceptable acid addition salts thereof. In addition, the invention relates to novel intermediates of use for such purpose.

Compounds belonging to this class of 1,4-dihydropyridines have shown activity as calcium-channel blockers and have found utility as anti-ischaemic and antihypertensive agents. Furthermore, compounds of this class have been used in the treatment of Raynaud's syndrome.

A particularly preferred compound of this class of 1,4-dihydropyridines is the compound, 2-(2-aminoethoxymethyl)-4-(2-chlorophenyl)-6-methyl-1,4-dihydro-20 pyridine-3,5-dicarboxylic acid 3-ethyl ester 5-methyl ester, known under the generic name, amlodipine.

EP 0 089 167 B discloses certain 1,4-dihydropyridines having an amino-containing group attached to the 2-position, i.a. amlodipine, and their preparation.

According to said patent, the 1,4-dihydropyridines are prepared by removal of the amino-protecting group from the corresponding amino-protected 1,4-dihydropyridine or by reduction of the corresponding azido compound into the amine. As well the amino-protected 1,4-dihydropyridines as the azido compounds are prepared by the well-known Hantzsch synthesis.

In Example 11 of the patent an overall yield of 1 %, only, is stated for the production of amlodipine maleate starting with the reaction of 2-azido ethanol with ethyl 4-chloroacetoacetate, whereas an overall

yield of 8.8 % is disclosed in a later publication by the inventors of EP 0 089 167 B, J. Med. Chem., (1986), 29, 1696 - 1702, see particularly pp. 1700 - 1701.

The overall yield for the alternative process has 5 not been given in the patent and cannot be calculated on the basis of the information given therein. However, in part calculated on the basis of yields reported by others having reproduced the process, the overall yield seems to be in the order of 12 - 20 %, starting with 10 the reaction of 2-phthalimido ethanol with ethyl 4-chloroacetoacetate and ending with removal of the protecting group and preparation of the maleate salt.

The present invention provides a process whereby the 1,4-dihydropyridines can be obtained in higher 15 overall yield. Furthermore, the use of potentially explosive azide starting materials (see e.g. Chem. Ind., (1986), 10, 337) is avoided.

By the process according to the invention, the 1,4-dihydropyridines are prepared starting from an 20 acetal intermediate which is reacted with hydroxylamine or a derivative thereof so as to produce an oxime intermediate which is reduced to provide the desired 1,4-dihydropyridine, optionally as a pharmaceutically acceptable acid addition salt thereof. Hereby the 1,4-dihydropyridines can be obtained in excellent yields. 25 E.g. amlodipine, maleate has been obtained in a yield of about 62 % calculated on the acetal intermediate.

Furthermore, the acetal intermediate in itself can be obtained in excellent yield by the Hantzsch synthesis, as described in the following. Thus, the 30 amlodipine acetal intermediate has been obtained in a yield of 42 % starting with the reaction of 2,2-diethoxyethanol with ethyl 4-chloroacetoacetate, and accordingly an overall yield of amlodipine, maleate of 35 29 %, calculated on the 2,2-diethoxyethanol, has been

obtained.

CA 2,188,071 A discloses a process for the preparation of 1,4-dihydropyridine derivatives, i.a. amlodipine, by reductive amination of the corresponding aldehyde using ammonium acetate and sodium cyanohydride in a protic solvent such as methanol, or reaction of the aldehyde with hydroxylamine hydrochloride and base to give the corresponding oxime followed by reduction with ammonium formate in methanol in the presence of palladium hydroxide on charcoal.

In CA 2,188,071 A it is stated that the dihydropyridine derivatives are formed in good yields employing easily available precursors, and that the overall yield is far greater than the prior art, i.e. 15 46 % for amlodipine. This yield, however, seems to be calculated on the compound, 4-(2-chlorophenyl)-2-(2,3-dihydroxypropoxymethyl)-1,4-dihydro-6-methyl-3,5-pyridinedicarboxylic acid 3-ethyl 5-methyl ester, in CA 2,188,071 A designated IC. But as this compound already 20 includes the 1,4-dihydropyridine ring, an "overall" yield calculated on this basis cannot be compared to the overall yields indicated above.

A calculation on a comparable basis, i.e. based on the compound being reacted with ethyl 4-chloroacetoacetate, viz. the compound 2,2-dimethyl-[1,3]dioxolane-4,5-dimethanol, gives a yield of the aldehyde intermediate of about 15 % resulting in an overall yield of amlodipine of about 7 %, i.e. several times smaller than the overall yield of about 29 % which has been 30 obtained via the acetal intermediate used as starting material in the process according to the invention.

Also the yields, which have been obtained by conversion of the aldehyde intermediate into amlodipine by the process according to CA 2,188,071 A (about 48 % 35 by the reductive amination and about 43 % by conversion

via the oxime), are far below the yield of about 62 %, which has been obtained by the process according to the invention using the acetal intermediate as starting material, which yield even includes the preparation of 5 the maleate salt.

Incidentally, CA 2,188,071 A discloses an acetal, viz. the compound 4-(2-chlorophenyl)-2-(2,2-dimethoxyethoxymethyl)-1,4-dihydro-6-methyl-3,5-pyridinedicarboxylic acid 3-ethyl 5-methyl ester, as well as its 10 preparation from 2,2-dimethoxyethanol and 2-(2-chloromethyl)-4-(2-chlorophenyl)-1,4-dihydro-6-methyl-3,5-pyridinedicarboxylic acid 3-ethyl 5-methyl ester and its conversion into a bicyclic structure forming an oxazine ring with the pyridine nitrogen atom (cf. 15 Examples 11 and 12). However, neither its conversion into the corresponding oxime nor its preparation by Hantzsch synthesis has been disclosed. There is no mentioning either of any possible use of the compound as intermediate in the preparation of amlodipine.

20 CA 2,188,071 A also includes a general formula XX for an acetal, but the formula includes two undefined substituents, R<sub>10</sub> and R<sub>11</sub>, and accordingly it cannot be considered an anticipating disclosure of any specific acetal. Furthermore, neither the conversion of the 25 acetal into the corresponding oxime nor its preparation by Hantzsch synthesis has been disclosed. There is no mentioning either of any possible use of the acetal as intermediate in the preparation of amlodipine or any other 1,4-dihydropyridine having a substituent with an 30 amino group in the 2-position of the 1,4-dihydropyridinium ring.

EP 225 175 A2 discloses a substantive number of 1,4-dihydropyridine derivatives and different processes for their preparation. Amlodipine is not among the 35 disclosed derivatives. One of the disclosed processes is

a process for the preparation of a 1,4-dihydropyridine derivative, which like the compounds prepared by the process according to the invention, has a (2-aminoethoxy)methyl substituent in the 2-position, but 5 differs from said compounds in having a fluoromethyl substituent in the 6-position. The 1,4-dihydropyridine derivative is prepared by reduction of the corresponding oxime which in turn is prepared by reaction of the corresponding acetal with hydroxylamine.

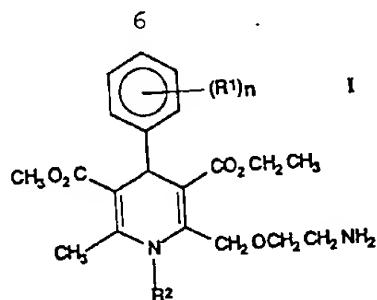

10 However, EP 225 175 A2 does not mention anything about the acetal being obtained directly by the Hantzsch synthesis and even less the particular advantages obtainable thereby.

15 On the contrary, the acetal is prepared from the corresponding bromomethyl substituted 1,4-dihydropyridine derivative obtained by reaction of the corresponding methyl substituted 1,4-dihydropyridine derivative with pyridinium perbromide, a process which would be unsuitable for the preparation of the acetal used in 20 the process according to the present invention due to side reactions.

Thus, it can be concluded, that the use of the acetal intermediate in the preparation of the particular 1,4-dihydropyridines being prepared by the process 25 according to the present invention presents substantive advantages over the prior art and cannot be considered obvious in view thereof.

Accordingly, the invention provides an inventive process for the preparation of 1,4-dihydropyridines of 30 the general formula I

5

wherein

R<sup>1</sup> each, independently, represents H, Cl or CF<sub>3</sub>,  
R<sup>2</sup> represents H, C<sub>1</sub>-C<sub>5</sub> alkyl, C<sub>3</sub>-C<sub>6</sub> cycloalkyl or

10 aralkyl, and

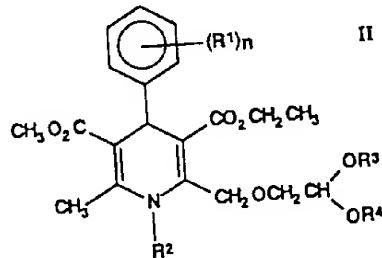

n is 1 or 2,

or acid addition salts thereof,

comprising the steps of reacting an acetal of the  
general formula II

15

20

wherein

R<sup>1</sup>, R<sup>2</sup> and n have the same meanings as defined

above, and

R<sup>3</sup> and R<sup>4</sup>, which may be the same or different,  
25 represent C<sub>1</sub>-C<sub>5</sub> alkyl, C<sub>3</sub>-C<sub>6</sub> cycloalkyl, aralkyl or  
together represent -(CH<sub>2</sub>)<sub>m</sub>-, wherein

m is 2 or 3,

with

30

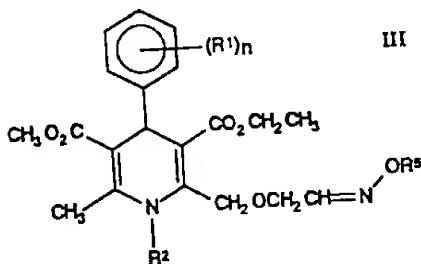

or an acid addition salt thereof, wherein

R<sup>5</sup> represents H, C<sub>1</sub>-C<sub>5</sub> alkyl, C<sub>3</sub>-C<sub>6</sub> cycloalkyl or  
aralkyl,

so as to provide an oxime of the general formula

III

5

III

wherein

10        R<sup>1</sup>, R<sup>2</sup>, R<sup>5</sup> and n have the same meanings as defined  
above, and

reducing the formed oxime of formula III so as to  
provide a 1,4-dihydropyridine of formula I, and, if  
desired, converting a compound of formula I obtained as  
15 the free base into a pharmaceutically acceptable acid  
addition salt thereof or vice versa.

The reaction of the acetal of formula II with  
R<sup>5</sup>ONH<sub>2</sub> or an acid addition salt thereof to give the  
oxime of formula III is carried out in an appropriate  
20 solvent, such as an alcoholic solvent comprising a  
lower alkanol, such as methanol, ethanol or isopropo-  
nol, e.g. in admixture with water. In a presently  
preferred embodiment an aqueous solution of R<sup>5</sup>ONH<sub>2</sub>  
hydrochloride is combined with a solution of the acetal  
25 in methanol, and the mixture is heated to reflux for a  
suitable period, such as 2 - 8 hours, normally around  
4 hours.

The reduction of the oxime of formula III into the  
desired 1,4-dihydropyridine of formula I is carried out  
30 using a suitable reduction agent selected from the  
numerous reduction agents being known for the reduction  
of oximes into amines, see e.g. the surveys given in R.  
C. Larock, "Comprehensive Organic Transformations", VCH  
Publishers, (1989). p. 424, Houben-Weyl: "Methoden der  
Organischen Chemie", Vol. E16d, Part 2, (1992), pp. 884

- 893, and Houben-Weyl: "Methoden der Organischen Chemie", Vol. XI/1, (1957), pp. 495 -504.

According to a particular embodiment of the invention, the reduction is carried out by catalytical hydrogenation, preferably using a nobel metal catalyst, such as platinum or palladium, or a Raney nickel catalyst. The reduction is preferably carried out under acidic conditions.

In a presently preferred embodiment, the reduction 10 is carried out by catalytical hydrogenation in acetic acid using palladium-on-carbon as a catalyst.

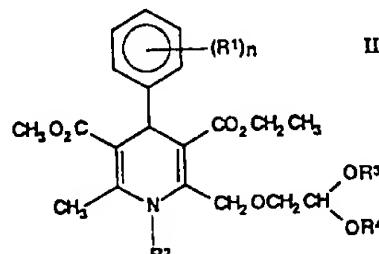

According to another, although less preferred embodiment of the invention, the reduction is carried out using sodium borohydride/nickel chloride hydrate as 15 reduction agent.

As other examples of catalysts, which may be of use for the present purpose, the following can be mentioned: sodium borohydride in combination with other compounds, such as titanium tetrachloride or molybdenum 20 trichloride; lithium aluminum hydride or zinc powder.

A compound of formula I obtained as the free base may, if desired, be converted into a pharmaceutically acceptable acid addition salt thereof or vice versa. The hydrochloride, hydrobromide, sulphate, phosphate or 25 acid phosphate, acetate, maleate, fumarate, besylate, lactate, tartrate, citrate and gluconate salts are examples of such pharmaceutically acceptable acid addition salts. The maleate and the besylate salts are particularly preferred.

With the exception of the compound 4-(2-chlorophenyl)-2-(2,2-dimethoxy-ethoxymethyl)-1,4-dihydro-6-methyl-3,5-pyridine-dicarboxylic acid 3-ethyl 5-methyl ester, the acetals of formula II are novel compounds and as such represent a particular aspect of the 35 invention.

A specific group of acetals according to the invention, are the compounds of the general formula II

wherein

10       $R^1$  each, independently, represents H, Cl or  $CF_3$ ,  
 $R^2$  represents H,  $C_1-C_5$  alkyl,  $C_3-C_6$  cycloalkyl or aralkyl,

15       $R^3$  and  $R^4$ , which may be the same or different, represent  $C_1-C_5$  alkyl,  $C_3-C_6$  cycloalkyl, aralkyl or together represent  $-(CH_2)_m-$ , wherein

$m$  is 2 or 3, and

$n$  is 1 or 2,

with the proviso that when  $R^2$  is H, and no  $R^1$  is  $CF_3$ , then  $R^3$  and  $R^4$  are other than methyl.

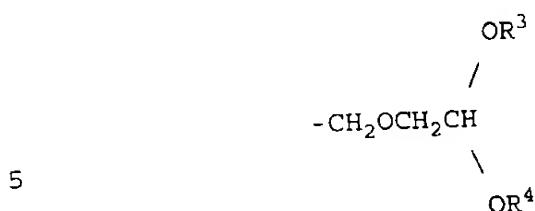

20      A preferred group of acetals of the general formula II is represented by the compounds wherein  $n$  is 1,  $R^1$  is chloro in the 2-position of the phenyl ring,  $R^2$  is H, and  $R^3$  and  $R^4$ , which may be the same or different, represent  $C_2-C_5$  alkyl.

25      Particularly preferred is the compound 4-(2-chlorophenyl)-2-(2,2-diethoxy-ethoxymethyl)-6-methyl-1,4-dihydro-pyridine-3,5-dicarboxylic acid 3-ethyl ester 5-methyl ester.

The acetals of formula II can be obtained directly 30 by the Hantzsch synthesis and have been obtained in excellent yield by this synthesis.

Accordingly, in a preferred embodiment of the process according to the invention the acetal of formula II is obtained by a Hantzsch synthesis carried 35 out using a compound containing a group of the formula

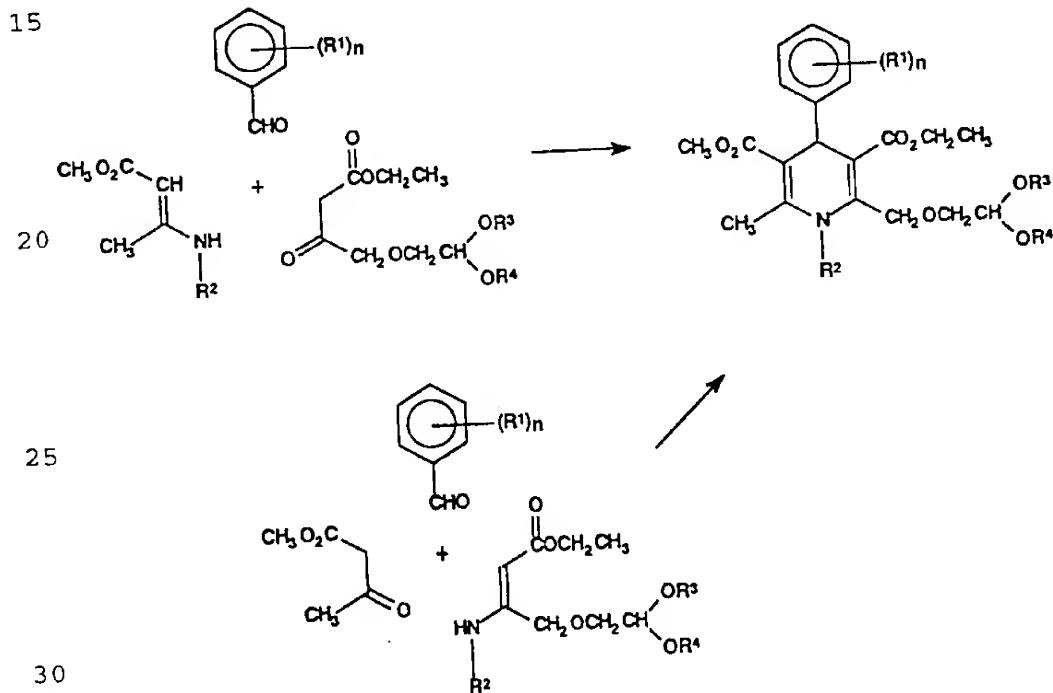

10

wherein

R<sup>3</sup> and R<sup>4</sup> have the same meanings as defined above,  
 10 as one of the reactants in the Hantzsch condensation.

In principle the Hantzsch synthesis is carried out by reacting an aldehyde with a  $\beta$ -keto ester and an aminocrotonic acid ester as illustrated in the following Scheme 1:

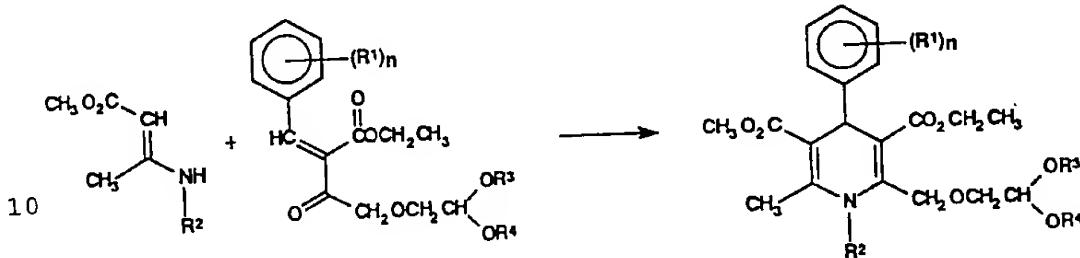

Scheme 1

However, as is known in the art, various modifications of the Hantzsch synthesis are possible.  
 35

11

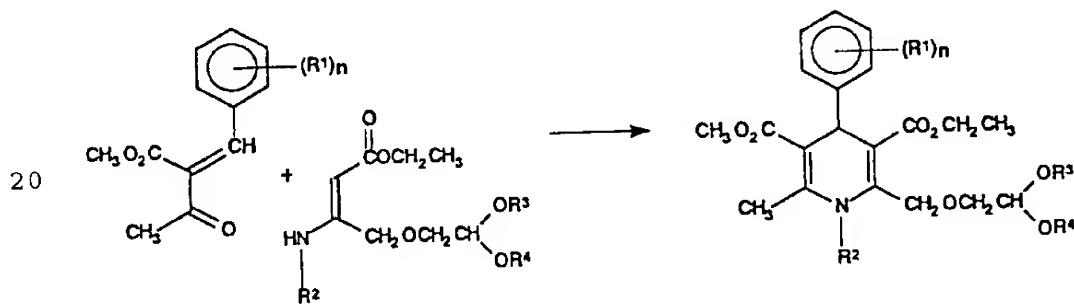

Instead of performing the reaction in one step as illustrated above, the synthesis can be carried out using preformed intermediates, e.g. as illustrated in the following Schemes 2, 3 and 4:

5

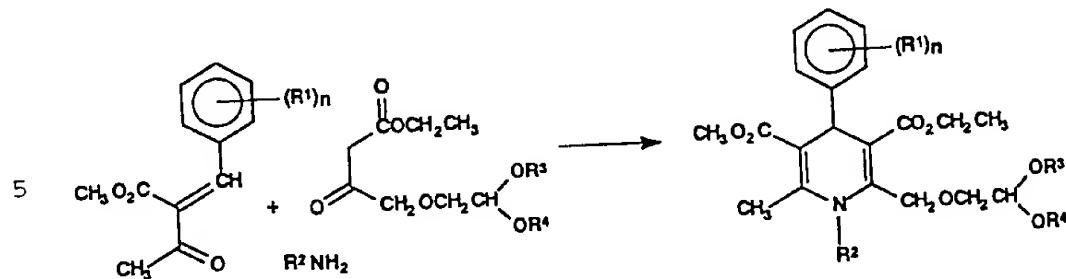

Scheme 2

15

### Scheme 3

25

Scheme 4

10

As will be appreciated by a person skilled in the art the above schemes are only examples and other modifications of the Hantzsch synthesis can be made 15 without deviating from the scope and spirit of the invention.

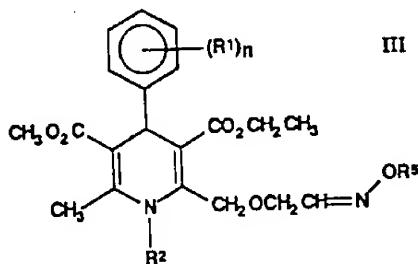

In a further preferred embodiment of the process according to the invention, the Hantzsch synthesis, or at least one step thereof, is carried out in a solvent 20 being capable of forming an azeotrope with water, particularly toluene, benzene or xylene. Hereby, water of reaction can be removed as an azeotrope with the solvent during the reaction.

Some of the oximes of formula III are novel 25 compounds and as such represent a particular aspect of the invention.

The only oximes of formula III being specifically disclosed in CA 2,188,071 A are the compound, 4-(2-chloro-phenyl)-2-(2-hydroxyimino-ethoxymethyl)-6-methyl-1,4-dihydro-pyridine-3,5-dicarboxylic acid 30 3-ethyl ester 5-methyl ester and the corresponding 2-methoxyimino compound.

Accordingly, the invention also relates to the oximes of the general formula III

13

wherein

R<sup>1</sup> each, independently, represent H, Cl or CF<sub>3</sub>,

R<sup>2</sup> represents H, C<sub>1</sub>-C<sub>5</sub> alkyl, C<sub>3</sub>-C<sub>6</sub> cycloalkyl or  
10 aralkyl,

R<sup>5</sup> represents H, C<sub>1</sub>-C<sub>5</sub> alkyl, C<sub>3</sub>-C<sub>6</sub> cycloalkyl or  
aralkyl, and

n is 1 or 2,

with the exception of the compounds 4-(2-chloro-  
15 phenyl)-2-(2-hydroxyimino-ethoxymethyl)-6-methyl-1,4-  
dihydro-pyridine-3,5-dicarboxylic acid 3-ethyl ester 5-  
methyl ester and 4-(2-chloro-phenyl)-2-(2-methoxyimino-  
ethoxymethyl)-6-methyl-1,4-dihydro-pyridine-3,5-dicar-  
boxylic acid 3-ethyl ester 5-methyl ester.

20 A particular group of compounds of formula III  
according to the invention are the compounds wherein

R<sup>1</sup> each, independently, represent H, Cl or CF<sub>3</sub>,

R<sup>2</sup> represents H, C<sub>1</sub>-C<sub>5</sub> alkyl, C<sub>3</sub>-C<sub>6</sub> cycloalkyl or  
aralkyl,

25 R<sup>5</sup> represents H, C<sub>1</sub>-C<sub>5</sub> alkyl, C<sub>3</sub>-C<sub>6</sub> cycloalkyl or  
aralkyl, and

n is 1 or 2,

with the proviso that when R<sup>2</sup> is H and no R<sup>1</sup> is CF<sub>3</sub>,  
then R<sup>5</sup> is C<sub>3</sub>-C<sub>6</sub> cycloalkyl or aralkyl.

30 In the present specification and claims, the  
definition C<sub>1</sub>-C<sub>5</sub> alkyl includes linear and branched  
alkyl groups like methyl, ethyl, propyl, incl. n-propyl  
and i-propyl, butyl, incl. n-butyl, sec.-butyl and  
tert.-butyl, and pentyl, incl. n-pentyl and tert.-  
35 pentyl. The definition C<sub>3</sub>-C<sub>6</sub> cycloalkyl includes

cyclopropyl, cyclobutyl, cyclopentyl and cyclohexyl, and the definition aralkyl includes groups having a phenyl or naphthyl group, particularly a phenyl group, as the aryl moiety and a C<sub>1</sub>-C<sub>5</sub> alkyl group as defined above as the alkyl moiety, the benzyl group being a particularly preferred aralkyl group.

The invention will now be further illustrated by specific examples which, however, should not be regarded as any limitation of the scope of the invention.

#### EXAMPLES.

##### Preparation of starting materials.

15

Example A. 4-(2,2-Diethoxy-ethoxy)-3-oxo-butyric acid ethyl ester (1).

To a stirred suspension of 58,8 g 60 % (1.47 mol) sodium hydride in 600 ml anhydrous tetrahydrofuran, a solution of 94 g (0.7 mol) 2,2-diethoxy-ethanol in 160 ml tetrahydrofuran was added dropwise, so that the temperature was kept below 40 °C. After completion of the addition, the reaction mixture was stirred for further 30 minutes. Then 115 g (0.7 mol) ethyl 4-chloroacetoacetate in 500 ml anhydrous tetrahydrofuran was added dropwise within 3 hours, so that the temperature was kept between 10 °C and 40 °C, preferentially at about 20 °C. The mixture was stirred overnight at room temperature. Then 90 ml ethanol was added dropwise, and the mixture was poured into 900 g of ice after which pH was adjusted to 6 with hydrochloric acid. The organic phase was separated and dried over MgSO<sub>4</sub>. The tetrahydrofuran was evaporated off and the product was separated from the oily layer in a separ-

15

ation funnel. Then the product was dissolved in toluene and purified by filtration through a short column of silica. The toluene was evaporated off, leaving the product as a light yellow oil. The product was purified 5 by distillation in vacuo.

Example B. 3-(2-chloro-phenyl)-2-[2-(2,2-diethoxy-  
25 ethoxy)-acetyl]-acrylic acid ethyl ester (cis and  
trans isomer) (2).

A solution of 53 g (0.38 mol) 2-chlorobenzaldehyde, 98 g (0.38 mol) 4-(2,2-diethoxy-ethoxy)-3-oxo-  
30 butyric acid ethyl ester (1) and 6 ml piperidine in  
1600 ml toluene was refluxed in a Dean-Stark water  
separator for four hours until 6.2 ml of water had been  
separated (theoretical amount = 6.5 ml). The reaction  
mixture was cooled to room temperature and washed twice  
35 with 200 ml of water, then with 500 ml of a saturated

16

solution of sodium bisulphite and finally with 200 ml of water. The mixture was dried over  $MgSO_4$  and the toluene was evaporated off to give the product as a dark red oil.

20 8.07, 7.97 (2 s cis,trans, 1H, CH); 7.48-7.12 (m, 4H, ArH); 4.656, 4.576 (2 t cis,trans, 2H, CH); 4.3 (d.d., 2H, CH<sub>2</sub>); 4.154 (m, 2H, CH<sub>2</sub>); 3.682 (m, 2H, CH<sub>2</sub>); 3.53 (m, 4H, CH<sub>2</sub>); 1.324 (t, 3H, CH<sub>3</sub>); 1.184 (t, 6H, CH<sub>3</sub>).

Example C. 3-amino-4-(2,2-diethoxy-ethoxy)but-2-enoic acid ethyl ester (3).

A mixture of 26.2 g (0.1 mol) 4-(2,2-diethoxy-ethoxy)-3-oxo-butyric acid ethyl ester (1) and 8.47 g (0.11 mol) of ammonium acetate in 75 ml of ethanol was 30 refluxed for 60 minutes. The ethanol was evaporated off and the resulting crude 3-amino-4-(2,2-diethoxy-ethoxy)but-2-enoic acid ethyl ester was dissolved in 100 ml of toluene and washed twice with 75 ml of water. The organic phase was evaporated off and the crude product 35 was distilled in vacuo giving the pure compound as a

colourless liquid.

25 Example F. 2,2-Diethoxy-ethanol.

302,6 g (8 mol) of sodium borohydride was added to 2 l of 1,2-dimethoxyethane (monoglyme) with stirring, after which 704,8 g (4 mol) ethyl diethoxyacetate dissolved in 4 l of ethanol was added dropwise within 4 hours so that the temperature was kept below 50 °C. The mixture was then heated to reflux for 3 hours. Then 2 l of ethanol was distilled off, and 4 l of water was added dropwise while the remaining ethanol and then the 35 1,2-dimethoxyethane was removed by distillation. During

21

the water addition an abundant precipitate was formed which dissolved towards the end of the addition.

The mixture was cooled on an icebath and 600 g of potassium carbonate was dissolved therein while stirring. The mixture was extracted with 2 l of diethyl ether and dried with  $MgSO_4$ . The diethyl ether was evaporated off and the crude product was distilled in vacuo at 75-76 °C (15 mm Hg).

## P A T E N T C L A I M S

1. A process for the preparation of 1,4-dihydropyridines of the general formula I

5

10 wherein

R<sup>1</sup> each, independently, represents H, Cl or CF<sub>3</sub>,

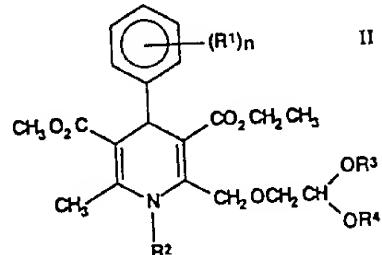

R<sup>2</sup> represents H, C<sub>1</sub>-C<sub>5</sub> alkyl, C<sub>3</sub>-C<sub>6</sub> cycloalkyl or aralkyl, and

n is 1 or 2,

15 or acid addition salts thereof,

comprising the steps of reacting an acetal of the general formula II

20

wherein

25 R<sup>1</sup>, R<sup>2</sup> and n have the same meanings as defined above, and

R<sup>3</sup> and R<sup>4</sup>, which may be the same or different, represent C<sub>1</sub>-C<sub>5</sub> alkyl, C<sub>3</sub>-C<sub>6</sub> cycloalkyl, aralkyl or together represent -(CH<sub>2</sub>)<sub>m</sub>-, wherein

30 m is 2 or 3,

with

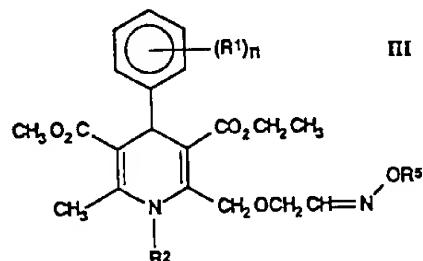

35 or an acid addition salt thereof, wherein

R<sup>5</sup> represents H, C<sub>1</sub>-C<sub>5</sub> alkyl, C<sub>3</sub>-C<sub>6</sub> cycloalkyl or aralkyl,

so as to provide an oxime of the general formula III

5

10

wherein

R<sup>1</sup>, R<sup>2</sup>, R<sup>5</sup> and n have the same meanings as defined above, and

reducing the formed oxime of formula III so as to 15 provide a 1,4-dihydropyridine of formula I, and, if desired, converting a compound of formula I obtained as the free base into a pharmaceutically acceptable acid addition salt thereof or vice versa.

20 2. A process according to claim 1, wherein the reduction of the oxime of formula III is carried out by catalytical hydrogenation.

25 3. A process according to claim 2, wherein the catalytical hydrogenation is carried out using a platinum, palladium or Raney nickel catalyst.

30 4. A process according to any of claims 1 - 3, wherein the reduction is carried out under acidic conditions.

35 5. A process according to any of claims 1 - 4, wherein the reduction is carried out by catalytical hydrogenation in acetic acid using palladium-on-carbon as a catalyst.

6. A process according to claim 1, wherein the reduction of the oxime of formula III is carried out using sodium borohydride/nickel chloride hydrate as reduction agent.

5

7. A process according to any of claims 1 - 6, wherein the acetal of formula II is obtained by a Hantzsch synthesis carried out using a compound containing a group of the formula

10

 $OR^3$ 

/

 $-CH_2OCH_2CH$ 

\

15  $OR^4$ 

wherein

$R^3$  and  $R^4$  have the same meanings as defined above, as one of the reactants in the Hantzsch condensation.

20

8. A process according to claim 7, wherein the Hantzsch synthesis, or at least one step thereof, is carried out in a solvent being capable of forming an azeotrope with water, particularly toluene, benzene or 25 xylene.

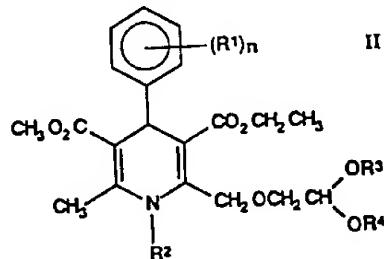

9. A process according to claim 7 or 8, wherein the Hantzsch synthesis, or at least one step thereof, is carried out under azeotropic removal of water of 30 reaction.

10. A process according to any of claims 1 - 9, wherein n is 1,  $R^1$  is chloro in the 2-position of the phenyl ring, and  $R^2$  is H.

30

## 11. An acetal of the general formula II

5

wherein

R<sup>1</sup> each, independently, represents H, Cl or CF<sub>3</sub>,10 R<sup>2</sup> represents H, C<sub>1</sub>-C<sub>5</sub> alkyl, C<sub>3</sub>-C<sub>6</sub> cycloalkyl or aralkyl,R<sup>3</sup> and R<sup>4</sup>, which may be the same or different, represent C<sub>1</sub>-C<sub>5</sub> alkyl, C<sub>3</sub>-C<sub>6</sub> cycloalkyl, aralkyl or together represent -(CH<sub>2</sub>)<sub>m</sub>-, wherein

15 m is 2 or 3, and

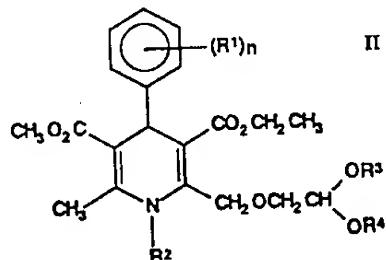

n is 1 or 2,

with the exception of the compound 4-(2-chlorophenyl)-2-(2,2-dimethoxy-ethoxymethyl)-1,4-dihydro-6-methyl-3,5-pyridine-dicarboxylic acid 3-ethyl 5-methyl ester.

20

## 12. An acetal of the general formula II

25

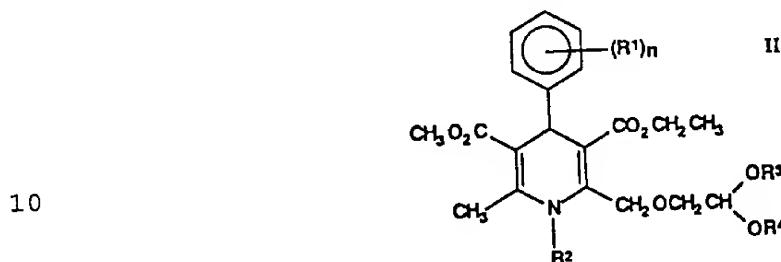

wherein

R<sup>1</sup> each, independently, represents H, Cl or CF<sub>3</sub>,30 R<sup>2</sup> represents H, C<sub>1</sub>-C<sub>5</sub> alkyl, C<sub>3</sub>-C<sub>6</sub> cycloalkyl or aralkyl,R<sup>3</sup> and R<sup>4</sup>, which may be the same or different, represent C<sub>1</sub>-C<sub>5</sub> alkyl, C<sub>3</sub>-C<sub>6</sub> cycloalkyl, aralkyl or together represent -(CH<sub>2</sub>)<sub>m</sub>-, wherein

35 m is 2 or 3, and

n is 1 or 2,  
 with the proviso that when R<sup>2</sup> is H, and no R<sup>1</sup> is CF<sub>3</sub>,  
 then R<sup>3</sup> and R<sup>4</sup> are other than methyl.

5        13. An acetal of the general formula II

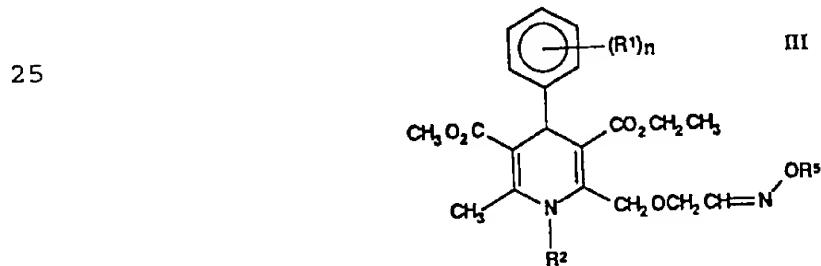

wherein

n is 1,  
 R<sup>1</sup> is chloro in the 2-position of the phenyl ring,  
 15      R<sup>2</sup> is H, and  
 R<sup>3</sup> and R<sup>4</sup>, which may be the same or different,  
 represent C<sub>2</sub>-C<sub>5</sub> alkyl.

14. The compound 4-(2-chlorophenyl)-2-(2,2-di-  
 20 ethoxy-ethoxymethyl)-6-methyl-1,4-dihydro-pyridine-3,5-  
 dicarboxylic acid 3-ethyl ester 5-methyl ester.

15. An oxime of the general formula III

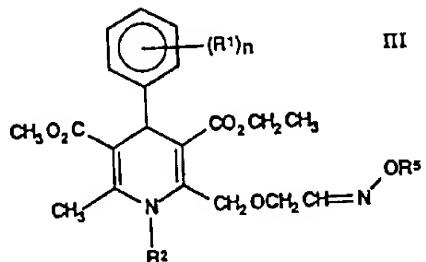

30 wherein

R<sup>1</sup> each, independently, represent H, Cl or CF<sub>3</sub>,  
 R<sup>2</sup> represents H, C<sub>1</sub>-C<sub>5</sub> alkyl, C<sub>3</sub>-C<sub>6</sub> cycloalkyl or  
 aralkyl,  
 R<sup>5</sup> represents H, C<sub>1</sub>-C<sub>5</sub> alkyl, C<sub>3</sub>-C<sub>6</sub> cycloalkyl or  
 35 aralkyl, and

n is 1 or 2,  
with the exception of the compounds 4-(2-chloro-phenyl)-2-(2-hydroxyimino-ethoxymethyl)-6-methyl-1,4-dihydro-pyridine-3,5-dicarboxylic acid 3-ethyl ester 5-methyl ester and 4-(2-chloro-phenyl)-2-(2-methoxyimino-ethoxymethyl)-6-methyl-1,4-dihydro-pyridine-3,5-dicarboxylic acid 3-ethyl ester 5-methyl ester.

16. An oxime of the general formula III

10

15

wherein

R<sup>1</sup> each, independently, represent H, Cl or CF<sub>3</sub>,

R<sup>2</sup> represents H, C<sub>1</sub>-C<sub>5</sub> alkyl, C<sub>3</sub>-C<sub>6</sub> cycloalkyl or aralkyl,

20 R<sup>5</sup> represents H, C<sub>1</sub>-C<sub>5</sub> alkyl, C<sub>3</sub>-C<sub>6</sub> cycloalkyl or aralkyl, and

n is 1 or 2,

with the proviso that when R<sup>2</sup> is H and no R<sup>1</sup> is CF<sub>3</sub>, then R<sup>5</sup> is C<sub>3</sub>-C<sub>6</sub> cycloalkyl or aralkyl.
